MPPT is a cutting-edge technology that constantly monitors the solar panel array and adjusts the inverter's output to extract the maximum possible power regardless of environmental conditions.

The maximum "adaptive" absorption time for the day is determined by the battery voltage as measured just before the solar charger begins operation each morning.

Let's say you have 5 100 watt incandescent bulbs, rated at 120 volts. This works out to $500 \text{ watts} / 120 \text{ volts} = 4.1667 \text{ amps}$. $120 \text{ volts} / 4.1667 \text{ amps} = 28.8 \text{ ohms}$. Now we up the ...
