In fact, multiple inheritance is the only case where `super()` is of any use. I would not recommend using it with classes using linear inheritance, where it's just useless overhead.

The automatic insertion of `super ()` by the compiler allows this. Enforcing `super` to appear first, enforces that constructor bodies are executed in the correct order which would ...

As for chaining `super::super`, as I mentionned in the question, I have still to find an interesting use to that. For now, I only see it as a hack, but it was worth mentioning, if only for the differences ...

`super()` is a special use of the `super` keyword where you call a parameterless parent constructor. In general, the `super` keyword can be used to call overridden methods, ...

I'm currently learning about class inheritance in my Java course and I don't understand when to use the `super()` call? Edit: I found this example of code where `super.variable` is used: `class A { ...`

`super()` lets you avoid referring to the base class explicitly, which can be nice. But the main advantage comes with multiple inheritance, where all sorts of fun stuff can happen.

"super" object has no attribute "`__sklearn_tags__`". This occurs when I invoke the `fit` method on the `RandomizedSearchCV` object. I suspect it could be related to compatibility ...

I wrote the following code. When I try to run it as at the end of the file I get this stacktrace: `AttributeError: "super" object has no attribute do_something` class `Parent`: `def ...`

The one without `super` hard-codes its parent's method - thus it has restricted the behavior of its method, and

subclasses cannot inject functionality in the call chain. The one ...

What is the difference between List<T> and List<T> extends T ? I used to use List<T> extends T, but it does not allow me to add elements to it list.add(e), whereas the Li...
