One major factor in battery performance is balancing. More specifically, whether the system uses active or passive battery balancing. While these might sound like technical ...

Battery equalization, also known as balancing, refers to the process of ensuring that all the cells in a battery pack are charged and discharged evenly, so that no cell becomes significantly ...

Balancing can be active or passive. In active balancing, the balancer circuit enables transfer of charge between different cells of the battery, i.e., transferring energy from cells with a higher charge to cells with a lower charge. The term battery regulator typically refers only to devices that perform passive balancing. A full BMS might include active balancing as well as temperature m...
